

# MatDL: Making Connections between MSE Education and Research

PI: Laura M. Bartolo (College of Arts & Sciences, KSU); CoPIs: Sharon C. Glotzer (Materials Science and Engineering, U-M), Javed I. Khan (Computer Science, KSU), Adam C. Powell IV (Materials Science and Engineering, MIT), Donald R. Sadoway (Materials Science and Engineering, MIT); Senior Investigators: Kenneth M. Anderson (Computer Science, CU), James A. Warren, Deputy Director, and Vinod K. Tewary, Research Scientist (Materials Science and Engineering Laboratory, NIST); Project Manager: Cathy S. Lowe (KSU)

**DUE-0333520**

## Transport Archive and Course Composer

### Transport Phenomena Archive

- Initiated by MIT
- Includes teaching resources:
  - Problems/exercises
  - Handouts & courseware
- Allows modifications & additions
- International editorial board
- Metis workflow technology (CU) for review process
- Initial content for testing course composer

- Enables flexible reuse
- Content selection:
  - LOM metadata
  - Graphical ontology
- Content adaptation:
  - Transcode
  - Compose
  - Output document

Student developers:  
 • Thong Chanchaem (KSU)  
 • Sandeep Kumar Davu (KSU)  
 • Yongbin Ma (KSU)

### Transport Resource Viewed in MatDL

### Problem/Exercise

1. Thermal properties and optimal materials selection  
 In many situations, product designs include parts whose only function is to conduct or resist the conduction of heat. Materials for these parts are thus chosen entirely on the basis of their thermal properties. Select the best material from the list provided for each of the following applications.

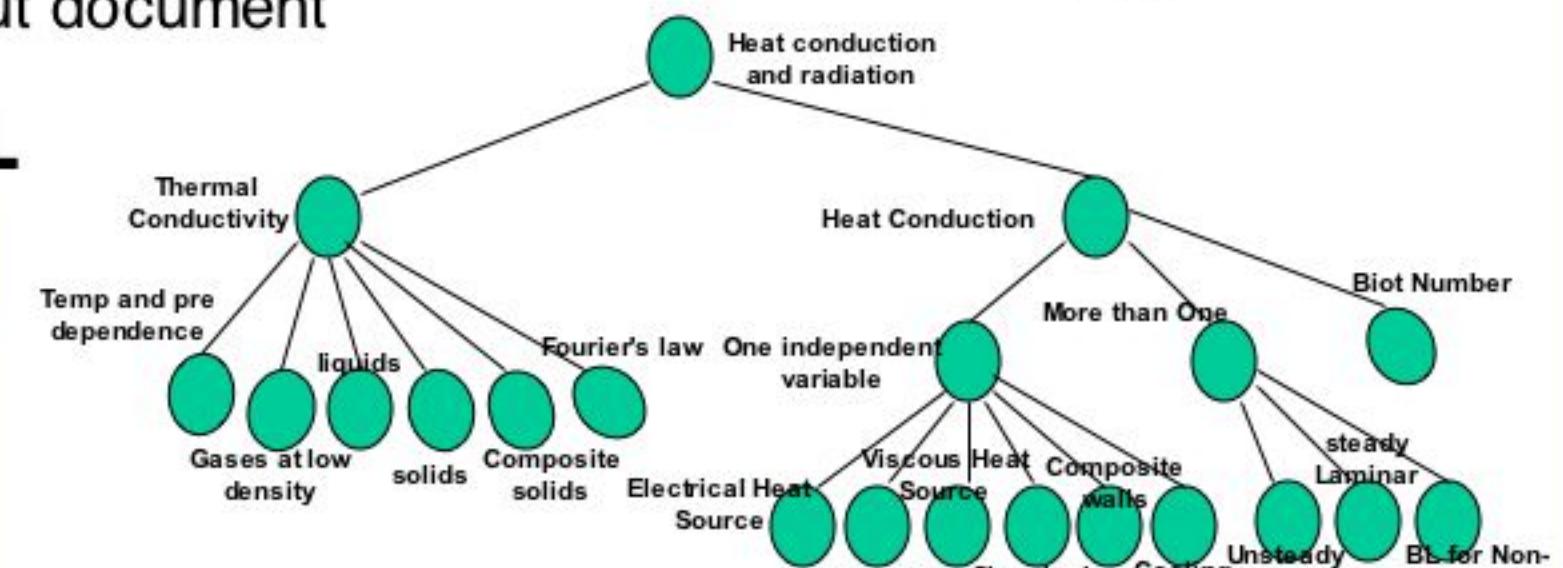

- Heat shield sandwiched between a hot body and a cold one which minimizes the steady flux between them.
- Heat shield which protects something from short, intense bursts of heat (long timescale is needed).
- Cheap (i.e. not diamond) temperature sensor, in which short timescale of heat conduction is necessary for rapid response.
- Light heat reservoir which must hold as much heat as possible per degree C per unit weight.
- Heat sink for a semiconductor device, which must minimize temperature difference for a given flux.
- Heat sink for melt spinning, in which liquid metal is injected against a rotating heat sink where it is solidified as rapidly as possible, so the material must conduct heat away from the surface quickly. (Hint: evaluate the flux through  $x = 0$  in an erfc-like unsteady conduction problem. Diamond is not an economically viable option.)

Candidate materials:

Material	$k, \text{W/mK}$	$\rho, \text{kg/m}^3$	$c_p, \text{J/g}\cdot\text{K}$	$\sigma, \text{W/m}^2$
aluminum	205	2700	870	100
copper	397	8.96	386	100
gold	315.5	19.3	130	100
silver	425	10.5	234	100
diamond	2320	3.5	519	100
graphite	63	2.25	711	100
lime (CaO)	15.5	3.32	749	100
silica ( $\text{SiO}_2$ )	1.5	2.32	687	100
alumina ( $\text{Al}_2\text{O}_3$ )	39	3.96	804	100

### LOM Metadata

### Partial Ontology

### Assembled Content

## MatML and Material Grapher

Materials Markup Language (MatML) is an XML-based language for exchange of materials property data

Currently:

- Few available MatML example resources
- Few examples using MatML with applications

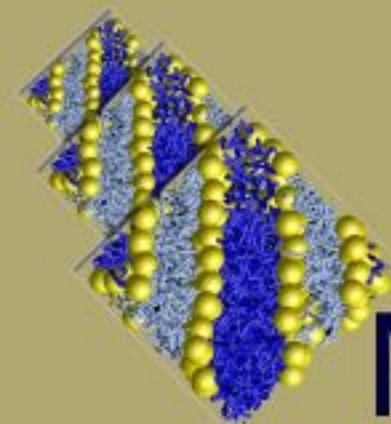

Goal:

- Provide complete example in educational context
  - Tagging materials property data with MatML
  - Parsing MatML
  - Using data in software application
  - “Real” data for realistic learning experience

### MatML Example: Selected Properties of Ti

# Materials Digital Library

MatDL.org

## Abstract

A primary goal of the Materials Digital Library (MatDL) is to bring materials science research and education closer together. MatDL is beginning to realize that goal by serving as an intersection for content, tools, and use among academe, government, industry, and the international community. MatDL is collaboratively developing a course composition tool (KSU), a submission tool (KSU and U-M), and a materials property grapher (KSU and MIT). An international editorial board is being assembled to review new contributions of teaching materials to the MatDL Transport Phenomena Archive using Metis workflow technology developed at CU. Archive resources, described with DC and LOM metadata, serve as initial content for testing the course composition tool which enables flexible reuse based on user selection criteria and dynamic topic weighting. The submission tool has been integrated into the regular workflow of U-M students and researchers generating nanostructure images. It prompts users for domain-specific information, automatically generating and attaching keywords and editable descriptions. MatML is an extensible markup language for exchanging materials information developed by materials data experts in industry, government, standards organizations, and professional societies. The web-based MatML grapher allows students to compare selected materials properties across approximately 80 MatML-tagged materials. The MatML grapher adds value in this educational context by allowing students to utilize real property data to make optimal material selection decisions. MatDL is also making available to interested students and researchers Python codes (FiPy) developed at NIST that use the finite volume method to solve partial differential equations and generate images.

## Submission Tool for Soft Matter Nanostructures

### Submission Template

Please Enter the Following Information. When finished click the "Begin Import" Button at the bottom of this page.  
\* Required Fields.

Title: DPD cylinders Time Evolution

Author (Last, First): Iacovella, Chris  
Add Another Author

Simulation Type: DPD simulation of a block copolymer

Number of Building Blocks: 2700

Dimensions of Building Block: 3 - 7

Concentration: 5

Delta A: 6

Run Temperature: 1

Number of Time Steps: 1000000

Final Phase: cylindrical

Final Description:

Description: A system of 2700 building blocks of composition 3 - 7 at a concentration of 5, was run starting at a disordered state at high temperature , then instantaneously quenched to a temperature of 1. The system was then run for 1000000 time steps forming a cylinders phase. Time evolution.

Click "Begin Import" when Finished

Begin Import

### Goal:

- Ensure adequate level of detail & consistency
- Organize results for intelligent access and storage

### Strategy:

- Provide drop-down selections & specific prompts
- Automatically generate keywords & description from responses

## Modeling and Simulation Tools

Materials Science and Engineering Laboratory/National Institute of Standards and Technology

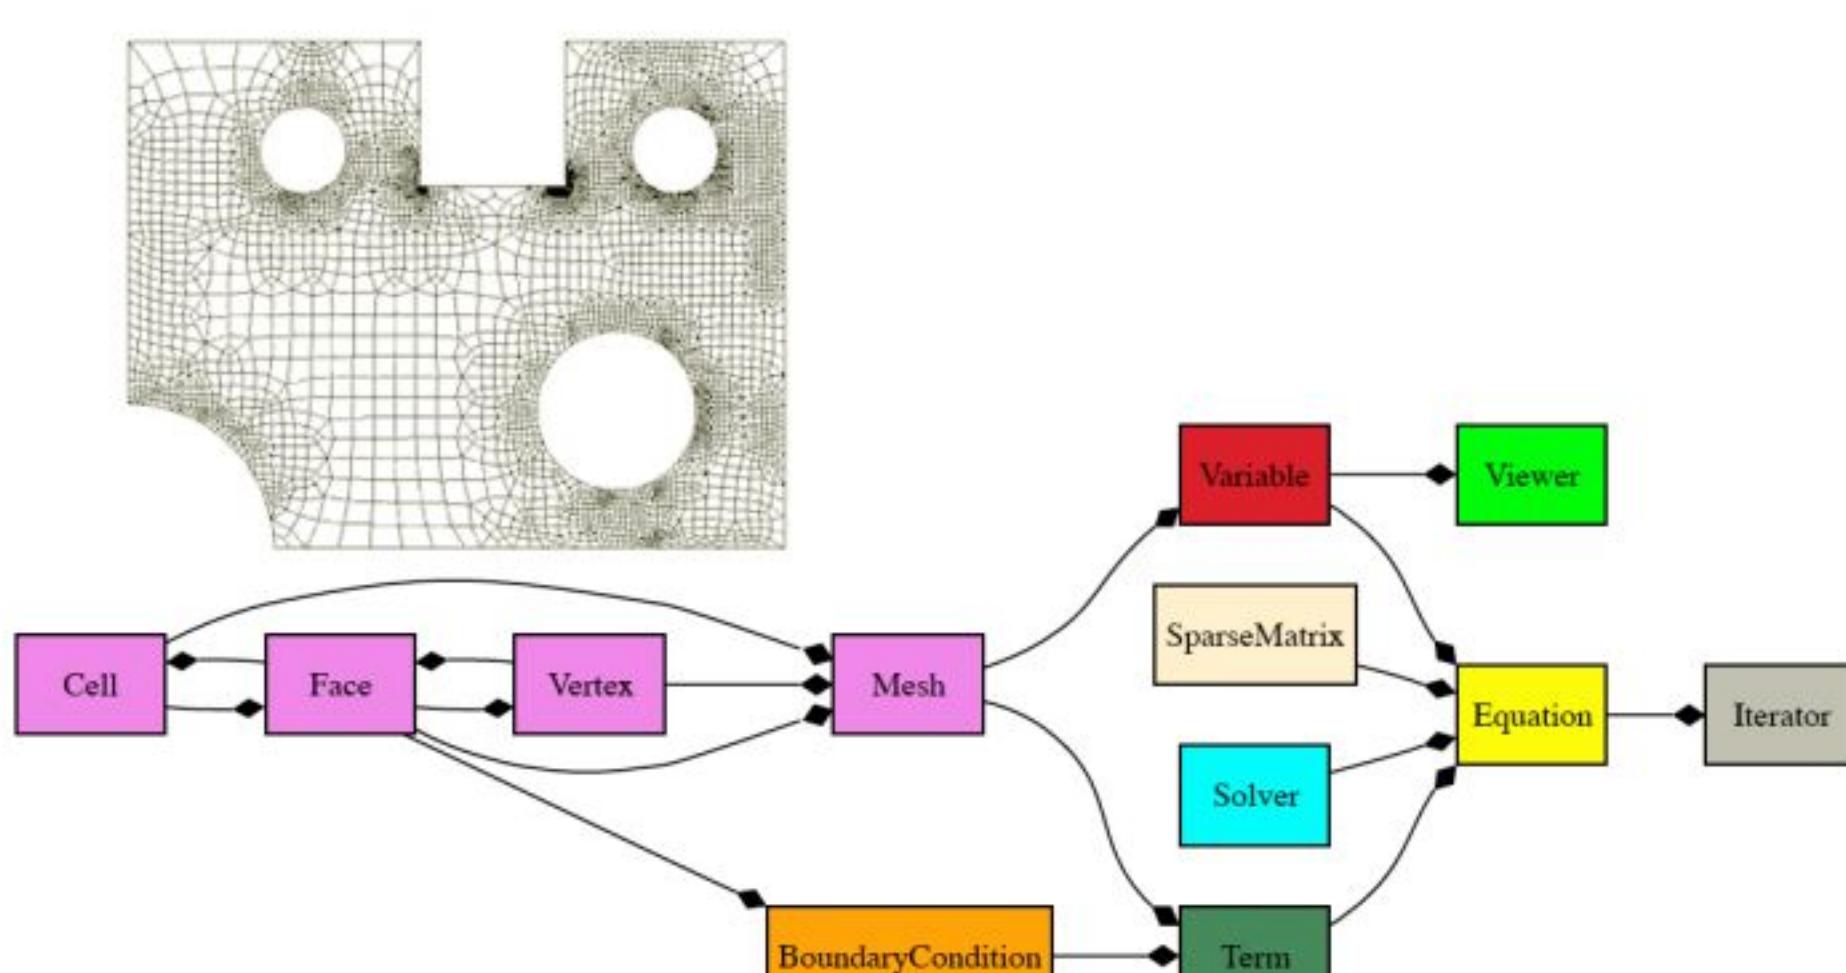

### A Finite Volume PDE Solver Using Python (FiPy)

Jonathan E. Guyer, Daniel Wheeler & James A. Warren  
Metallurgy Division

#### FiPy Overview

- Finite Volume code for solving coupled sets of PDEs
- Code currently addresses Phase Field models
- Code will be freely available
- Large archive of test problems
- User controls program flow

#### FiPy Design - Objects

#### Finite Volume Method

- Solve a general PDE on a given domain for a field  $\phi$
- Integrate PDE over arbitrary control volumes
- Evaluate PDE over polyhedral control volumes
- Obtain a large coupled set of linear equations in  $\phi$

$$\begin{pmatrix} a_{11} & a_{12} & & \\ a_{21} & a_{22} & \ddots & \\ & \ddots & \ddots & \ddots \\ & & \ddots & a_{nn} \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \vdots \\ \phi_n \end{pmatrix} = \begin{pmatrix} b_1 \\ b_2 \\ \vdots \\ b_n \end{pmatrix}$$

#### Example Problem - Grain Impingement Governing Equations

##### Phase field variable

$$0 \leq \phi \leq 1$$

$$Q(\phi, \nabla \theta) \frac{\partial \phi}{\partial t} = \underbrace{\alpha^2 \nabla^2 \phi}_{\text{transient}} - \underbrace{\frac{\partial f}{\partial \phi}}_{\text{diffusion}} - \underbrace{\frac{\partial g}{\partial \phi} s |\nabla \phi|}_{\text{source}} - \frac{\partial h}{\partial \phi} \frac{\epsilon^2}{2} |\nabla \phi|^2$$

R. Koyayashi, W. C. Carter, and J. A. Warren

##### Orientation variable

$$-\pi \leq \theta \leq \pi$$

$$P(\phi, \nabla \theta) \frac{\partial \theta}{\partial t} = \underbrace{\nabla \cdot [h \epsilon^2 \nabla \theta + g s \frac{\nabla \theta}{|\nabla \theta|}]}_{\text{transient}} + \underbrace{g s \frac{\nabla \theta}{|\nabla \theta|}}_{\text{diffusion}}$$
